Android Application Development

Today, Android technology is considered to be one of the fastest growing areas in the mobile-app world. Android allows developers to create code that can control mobile devices via Google-enabled Java libraries and this in turn has created a new wave in the mobile industry.

Phone Apps

hSenid Outsourcing approaches Google Android Application Development in a unique and creative manner. Utilizing the complex Google Android SDK platform, our highly skilled Android developers work on Android SDK's APIs, debugging tools, handset emulators and sample code to create effective, risk-free phone apps to run smoothly on Android powered phones.

Tablet Apps

More and more, businesses are investing in a full tablet experience for their apps and are seeing those investments pay off big. The increased screen area on tablets opens up a world of possibilities, allowing for more engagement with the user, which can mean an increase in usage as well as more monetization opportunities. And with the growing wave of Android tablets that continue to hit the market, it's an important piece of hSenid Outsourcing's mobile offering.
